Introduction

● eVoting

● protocols

● eVoting protocols

● privacy

Privacy in eVoting

Receipt-freeness

Strong RF

Conclusions

Involved parties:

- voters
- candidates
- voting officials (administrators):
 - ◆ counter(s)
 - ◆ registrar(s)
 - ◆ anonymous channel(s)
 - ◆ ...

Introduction

● eVoting

● protocols

● eVoting protocols

● privacy

Privacy in eVoting

Receipt-freeness

Strong RF

Conclusions

Intuitively:

A prescribed way to exchange messages between parties, in order to achieve a stated goal, satisfying stated requirements.

Note: distinction between roles and parties. From now on: roles.

eVoting protocols

Introduction

- eVoting
- protocols
- eVoting protocols
- privacy

Privacy in eVoting

Receipt-freeness

Strong RF

Conclusions

- goal: establish consensus in a group
- requirements:
 - ◆ democracy
 - ◆ eligibility
 - ◆ accuracy
 - ◆ verifiability
 - ◆ ...
 - ◆ privacy

Introduction

- eVoting
- protocols
- eVoting protocols
- **privacy**

Privacy in eVoting

Receipt-freeness

Strong RF

Conclusions

Two sides to privacy:

- uncertainty
- indistinguishability
 - ◆ k-anonymity...
 - ◆ ...anonymity groups!!

What is privacy?

Introduction

Privacy in eVoting

● What is privacy?

● existing notions

Receipt-freeness

Strong RF

Conclusions

what is to be kept private?

- voter?
- link voter-ballot?
- link voter-candidate?
- link ballot-candidate?

existing notions

Introduction

Privacy in eVoting

● What is privacy?

● existing notions

Receipt-freeness

Strong RF

Conclusions

Existing notions of privacy in eVoting:

- Anonymity
 - link voter-ballot cannot be determined by observation

- receipt-freeness
 - no proof

- strong receipt-freeness
 - no elimination of possibilities

- coercion-resistance
 - ◆ no randomisation
 - ◆ no abstention
 - ◆ no simulation

A receipt proves how a voter voted.

Introduction

Privacy in eVoting

Receipt-freeness

● intuition

● requirements

● decomposing receipts

Strong RF

Conclusions

Introduction

Privacy in eVoting

Receipt-freeness

● intuition

● requirements

● decomposing receipts

Strong RF

Conclusions

A receipt proves how a voter voted.

Examples:

- Everyone signs their vote.

A receipt proves how a voter voted.

Examples:

- Everyone signs their vote.
- In Italy, simultaneous elections were held for various posts, using one ballot. The order of posts listed is up to the voter, and is preserved. An attacker (El Mafiosi) can assign each voter a specific order of posts.

Benaloh & Tuinstra

requirements

Introduction

Privacy in eVoting

Receipt-freeness

- intuition
- requirements
- decomposing receipts

Strong RF

Conclusions

More precisely: a receipt r proves that a voter v *cast* a vote for candidate c .

requirements

Introduction

Privacy in eVoting

Receipt-freeness

● intuition

● requirements

● decomposing receipts

Strong RF

Conclusions

More precisely: a receipt r proves that a voter v *cast* a vote for candidate c .

- R1: r authenticates v
- R2: r proves that v chose candidate c
- R3: r proves that v cast her vote

requirements

Introduction

Privacy in eVoting

Receipt-freeness

● intuition

● requirements

● decomposing receipts

Strong RF

Conclusions

More precisely: a receipt r proves that a voter v *cast* a vote for candidate c .

- R1: r authenticates v
- R2: r proves that v chose candidate c
- R3: r proves that v cast her vote

Note:

- for specific types of elections
- quite strict

decomposing receipts

Introduction

Privacy in eVoting

Receipt-freeness

● intuition

● requirements

● decomposing receipts

Strong RF

Conclusions

The following functions are used to decompose receipts:

- $\alpha: \mathcal{R} \rightarrow \mathcal{AT}$, extract authentication term from receipt
- $\beta: \mathcal{R} \rightarrow \mathcal{RB}$, extract ballot from receipt
- $\gamma: \mathcal{R} \rightarrow \mathcal{C}$, extract candidate from receipt

Formalisation of the requirements:

decomposing receipts

Introduction

Privacy in eVoting

Receipt-freeness

● intuition

● requirements

● decomposing receipts

Strong RF

Conclusions

The following functions are used to decompose receipts:

- $\alpha: \mathcal{R} \rightarrow \mathcal{AT}$, extract authentication term from receipt
- $\beta: \mathcal{R} \rightarrow \mathcal{RB}$, extract ballot from receipt
- $\gamma: \mathcal{R} \rightarrow \mathcal{C}$, extract candidate from receipt

Formalisation of the requirements:

- R1: $\alpha(r) \in \mathcal{AT}(v)$
- R2: $\gamma(r) = \Gamma(v)$
- R3: $\beta(r) \in \mathcal{RB}$

The following functions are used to decompose receipts:

- $\alpha: \mathcal{R} \rightarrow \mathcal{AT}$, extract authentication term from receipt
- $\beta: \mathcal{R} \rightarrow \mathcal{RB}$, extract ballot from receipt
- $\gamma: \mathcal{R} \rightarrow \mathcal{C}$, extract candidate from receipt

Formalisation of the requirements:

- R1: $\alpha(r) \in \mathcal{AT}(v)$
- R2: $\gamma(r) = \Gamma(v)$
- R3: $\beta(r) \in \mathcal{RB}$

So, for valid receipts: $auth(\alpha(r)) = v \implies \gamma(r) = \Gamma(v)$, which is satisfied by $\gamma = \Gamma \circ auth \circ \alpha$.

RF \approx anonymity

Anonymity, 3 flavours:

- sender/voter anonymity?
no, voter tries to prove vote

Introduction

Privacy in eVoting

Receipt-freeness

Strong RF

● RF \approx anonymity

● unlinkability

Conclusions

RF \approx anonymity

Introduction

Privacy in eVoting

Receipt-freeness

Strong RF

● RF \approx anonymity

● unlinkability

Conclusions

Anonymity, 3 flavours:

- sender/voter anonymity?
no, voter tries to prove vote
- plausible deniability?
no, sender knows how she voted

RF \approx anonymity

Introduction

Privacy in eVoting

Receipt-freeness

Strong RF

● RF \approx anonymity

● unlinkability

Conclusions

Anonymity, 3 flavours:

- sender/voter anonymity?
no, voter tries to prove vote
- plausible deniability?
no, sender knows how she voted
- unlinkability?
“no link between vote and voter”...

Introduction

Privacy in eVoting

Receipt-freeness

Strong RF

● RF \approx anonymity

● unlinkability

Conclusions

Unlinkability of message m to sender v :

- intruder does not know that v sent m
- intruder cannot rule out that v sent any message m' , where $m' \in AS$, the Anonymity Set

Unlinkability of message m to sender v :

- intruder does not know that v sent m
- intruder cannot rule out that v sent any message m' , where $m' \in AS$, the Anonymity Set

Strong receipt-freeness

the intruder cannot rule out *any* vote from the anonymity set.

$$t.(v \rightarrow \text{spy} : r) \models (\neg \Box_{\text{spy}}(v \text{ sends } m)) \wedge \bigwedge_{m' \in AMS} \Diamond_{\text{spy}}(v \text{ sends } m')$$

currently: two approaches

Introduction

Privacy in eVoting

Receipt-freeness

Strong RF

Conclusions

● currently: two approaches

● future: unifying approach

Current situation:

- Delaune, Kremer and Ryan proposed an approach based on bisimilarity
 - ignoring the notion of receipts
- Jonker and De Vink proposed an approach based on the characteristics of a receipt
 - founded on the notion of receipts

future: unifying approach

Introduction

Privacy in eVoting

Receipt-freeness

Strong RF

Conclusions

● currently: two approaches

● future: unifying approach

- branching bisimilarity as an equivalence seems to strong e.g. order in which voters vote does not affect rf
- checking terms J&DV-style seems imprecise not a precise notion of receipts
- so unite the two!
construct an appropriate equivalence notion for voting processes based on identifying receipts

future: unifying approach

Introduction

Privacy in eVoting

Receipt-freeness

Strong RF

Conclusions

● currently: two approaches

● future: unifying approach

- branching bisimilarity as an equivalence seems to strong e.g. order in which voters vote does not affect rf
- checking terms J&DV-style seems imprecise not a precise notion of receipts
- so unite the two!
construct an appropriate equivalence notion for voting processes based on identifying receipts

Thanks for your attention!
